AMENDMENTS TO THE CLAIMS

1. (Currently amended) A method of operating an inspection apparatus to inspect a device used in a manufacturing process, said method comprising the steps of:

scanning the device;

displaying a plurality of images corresponding to respective <u>scanned</u> areas of the device;

selecting at least two of the plurality of displayed images based on an inputting at least two of desired scanned images to be inspected that have been selected by a user of the inspection apparatus, the desired scanned images being selected from the images corresponding to the scanned areas of the device;

deriving a spatial relationship between the selected input desired scanned images; and

forming a pattern to be recognized on the device from the selected input desired scanned images and the derived spatial relationship.

- 2. (Currently amended) The method of claim 1 further comprising the step of storing information associated with the selected input desired scanned images and the derived spatial relationship on a computer readable medium of the inspection apparatus.
- 3. (Currently amended) The method of claim 2 further comprising using said stored selected input desired scanned images and the stored derived spatial relationship in a pattern recognition analysis to detect defects in the device.

4. (Currently amended) The method of claim 2 further comprising using said stored selected input desired scanned images and the stored derived spatial relationship in a pattern recognition analysis to detect desired patterns in the device.

5. (Currently amended) The method of claim 1 wherein said selecting inputting step comprises:

displaying at least two image selection windows with the displayed images; and

inputting data corresponding to the selected input desired scanned images in response to the user placing the at least two image selection windows over respective displayed images.

- 6. (Original) The method of claim 5 wherein the image selection windows are placed over images corresponding to properly formed areas of the device.
- 7. (Original) The method of claim 5 wherein the image selection windows are placed over images corresponding to defectively formed areas of the device.
- 8. (Previously presented) The method of claim 5 wherein the user of the apparatus is prompted for a number of image selection windows to be displayed.
- 9. (Currently amended) The method of claim 1 wherein said selecting inputting step comprises:

displaying an image selection window with the displayed images;

inputting data corresponding to one of the selected input desired scanned images in response to the user placing the image selection window over a displayed image;

determining if another image selection window is required; and

if another image selection window is required, repeating said steps of displaying an image selection window, inputting data corresponding to one of the selected input desired scanned images and determining if another image selection window is required.

- 10. (Original) The method of claim 9 wherein the image selection windows are placed over images corresponding to properly formed areas of the device.
- 11. (Original) The method of claim 9 wherein the image selection windows are placed over images corresponding to defectively formed areas of the device.
- 12. (Original) The method of claim 1 wherein the device is a semiconductor wafer.
- 13. (Original) The method of claim 12 wherein the areas are contacts formed in the wafer.
- 14. (Currently amended) The method of claim 13 wherein the contact areas have desired and undesired features and said selecting inputting step comprises:

displaying at least two image selection windows with the displayed images; and

inputting data corresponding to the selected input desired scanned images in response to the user placing the at least two image selection windows over images associated with the desired features of the contact areas.

15. (Currently amended) The method of claim 13 wherein the contact areas have desired and undesired features and said selecting inputting step comprises:

displaying at least two image selection windows with the displayed images; and

inputting data corresponding to the selected <u>input desired scanned</u> images in response to the user placing the at least two image windows over images associated with the undesired features of the contact areas.

16. (Currently amended) The method of claim 13 wherein the contact areas have desired and undesired features and said selecting inputting step comprises:

displaying an image selection window with the displayed images;

inputting data corresponding to one of the selected input desired scanned images in response to the user placing the image selection window over an image associated with the desired feature of a contact area;

determining if another image selection window is required; and

if another image selection window is required, repeating said steps of displaying an image selection window, inputting data corresponding to one of the selected input desired scanned images and determining if another image selection window is required.

- 17. (Original) The method of claim 1 wherein the device is a reticle.
- 18. (Currently amended) The method of claim 1 wherein the derived spatial relationship comprises respective spatial relationships between pairs of the selected input desired scanned images.
- 19. (Currently amended) A method of inspecting a semiconductor wafer having objects formed therein, said method comprising the steps of:

scanning the wafer;

displaying a plurality of images corresponding to respective <u>scanned</u> areas in the wafer;

selecting at least two of the plurality of displayed images based on at least one selection of a desired <u>scanned</u> image by a user of an inspection apparatus;

deriving a relationship between the selected images, the derived relationship being determined by forming vectors in at least two dimensions between the selected images; and

forming a pattern to be recognized on the wafer from the selected images and the derived relationship.

- 20. (Original) The method of claim 19 further comprising the step of storing information associated with the selected images and the derived relationship on a computer readable medium of the inspection apparatus.
- 21. (Original) The method of claim 20 further comprising using said stored selected images and the stored derived relationship in a pattern recognition analysis to detect defects in the wafer.
- 22. (Original) The method of claim 20 further comprising using said stored selected images and the stored derived relationship in a pattern recognition analysis to detect desired patterns in the wafer.
- 23. (Currently amended) A method of inspecting a semiconductor device having objects formed therein, said method comprising the steps of:

scanning the device to obtain scanned object images;

selecting at least two of the scanned object images; and

forming a pattern to be recognized on the device from the selected images and a spatial relationship between the images, the spatial relationship being determined by forming vectors in at least two dimensions between the selected images,

wherein features that are not to be included in the pattern to be recognized are filtered out during said selecting step.

24. (Currently amended) An inspection apparatus for use in inspecting a manufacturing device used in a manufacturing process, said apparatus comprising:

a scanning device, said scanning device obtaining images of the manufacturing device;

a display;

an input device to be manipulated by a user for selecting desired features of an image to be inspected; and

a processor coupled to said scanning device, said display and said input device, said processor controlling said scanning device to scan the manufacturing device, said processor displaying on said display a plurality of images corresponding to respective <u>scanned</u> areas of the manufacturing device, said processor inputting at least two user selected <u>desired scanned</u> images from the input device, <u>said user selected</u> <u>images corresponding to scanned images displayed on the display</u>, deriving a spatial relationship between the user selected images and forming a pattern to be recognized on the manufacturing device from the user selected images and the derived spatial relationship.

25. (Previously presented) The apparatus of claim 24 further comprising:

a computer readable storage medium coupled to said processor, wherein said processor stores information associated with the user selected images and the derived spatial relationship on said computer readable medium.

26. (Original) The apparatus of claim 25 wherein said stored selected images and the stored derived spatial relationship are used by the processor in a pattern recognition analysis to detect defects in the manufacturing device.

- 27. (Original) The apparatus of claim 25 wherein said stored selected images and the stored derived spatial relationship are used by the processor in a pattern recognition analysis to detect desired patterns in the manufacturing device.
- 28. (Previously presented) The apparatus of claim 24 wherein said processor inputs the user selected images by displaying on said display at least two image selection windows with the displayed images and inputting data corresponding to images selected by the user by placement of the selection windows via said input device.
- 29. (Previously presented) The apparatus of claim 28 wherein the user of the apparatus is prompted for a number of images windows to be displayed.
- 30. (Previously presented) The apparatus of claim 24 wherein said processor inputs the user selected images by displaying an image selection window on said display with the displayed images, inputting data corresponding to images selected by the user by placement of the image selection windows via said input device, determining if another image selection window is required, and if another image selection window is required, continuing to display an image selection window, inputting data and determining if another window is required until no further windows are required.
- 31. (Original) The apparatus of claim 24 wherein the manufacturing device is a semiconductor wafer.

32. (Original) The apparatus of claim 31 wherein the areas are contact areas formed in the wafer.

- 33. (Original) The apparatus of claim 24 wherein the manufacturing device is a reticle.
- 34. (Original) The apparatus of claim 24 wherein the derived spatial relationship comprises respective spatial relationships between pairs of the selected images.
- 35. (Currently amended) An inspection apparatus for use in inspecting a semiconductor wafer, said apparatus comprising:

a scanning device, said scanning device obtaining images of a wafer; a display;

an input device for use by a user of the apparatus for selecting desired features of an image to be inspected; and

a processor coupled to said scanning device, said display and said input device, said processor controlling said scanning device to scan a wafer, said processor displaying on said display a plurality of images corresponding to areas of the scanned wafer, said processor inputting at least two user selected images from the input device, deriving a relationship between the user selected images and forming a pattern to be recognized on the scanned wafer from the user selected images and the derived relationship, wherein the derived relationship is determined by forming vectors in at least two dimensions between the user selected images.

36. (Original) The apparatus of claim 35 further comprising:

a computer readable storage medium coupled to said processor, wherein said processor stores information associated with the selected images and the derived relationship on said computer readable medium.

- 37. (Original) The apparatus of claim 36 wherein said stored selected images and the stored derived relationship are used by the processor in a pattern recognition analysis to detect defects in the scanned wafer.
- 38. (Original) The apparatus of claim 36 wherein said stored selected images and the stored derived relationship are used by the processor in a pattern recognition analysis to detect desired patterns in the scanned wafer.
- 39. (Currently amended) An inspection apparatus for use in inspecting a semiconductor wafer, said apparatus comprising:

a scanning device, said scanning device obtaining images of a wafer;

an input device for use by a user of the apparatus for selecting desired features of an image to be inspected; and

a processor coupled to said scanning device and said input device, said processor controlling said scanning device to scan a wafer, said processor inputting at least two user selected images from the input device and forming a pattern to be recognized on the scanned wafer from the user selected images and a spatial relationship between the images, wherein the derived relationship is determined by forming vectors in at least two dimensions between the user selected images.
